

Currency Converter Android Application Internship

Project Documentation

Intern ID: CITS3045

Name: Harsh Dhakad

Organization: CODTECH IT SOLUTIONS

Domain: Android Development

Project: Currency Converter Android Application

Introduction

This Android application converts currencies using live exchange rates fetched from an online API. The application is developed using Java and XML in Android Studio and stores conversion history using SQLite.

Objective

To provide real-time currency conversion with a simple, user-friendly interface while demonstrating Android development concepts such as API integration, JSON parsing, SQLite database usage, and Material Design.

Features

- Live Exchange Rates
- Currency Search
- Currency Swap
- Conversion History
- SQLite Database
- Splash Screen
- Material Design UI
- Internet Connectivity Check

Technologies Used

Java, XML, Android Studio, Volley Library, SQLite Database, ExchangeRate API, Git, GitHub.

System Workflow

Splash Screen → Main Activity → Fetch Exchange Rates → User Selects Currencies → Convert Amount → Display Result → Save History → View History.

Database

SQLite stores conversion history with From Currency, To Currency, Amount, Converted Amount, and Date/Time.

Future Enhancements

Dark Mode, Favorite Currencies, Offline Rates, Charts, Multi-language Support, Better UI and Analytics.

Conclusion

The project demonstrates Android application development using Java, REST API integration, SQLite, RecyclerView, and Material Design. It is suitable for internship submission.

Note: Screenshots are not included in this version of the documentation. The complete application source code is available in this GitHub repository and can be executed in Android Studio.
